## ADAPTIVE DISPLAY FOR VIDEO CONFERENCES

### ABSTRACT OF THE DISCLOSURE

5 A communication terminal for video conferencing with remote  
participants, including a receiver receiving audio and video signals from a  
plurality of the remote participants, and a display. In one form, a  
comparator compares the audio signals and a controller controls the  
display to display the video images extracted from the video signals based  
on the comparison of the received audio signals. In another form, the  
display has a height greater than its width and operates in a portrait mode  
in a default condition, and a controller controls the display to display the  
10 extracted video images in a landscape mode when the receiver receives  
the video signals from a plurality of the remote participants. In yet another  
form, a processor associates the received audio signals with the video  
signal received from the same remote participant, with the display  
displaying one of the video images on the right and another video image  
15 on the left, where an audio output sends the audio signal associated with  
the one video signal to a right speaker and sends the audio signal  
associated with the other video signal to a left speaker.
